

Jython

Introduction to Jython programming

Agenda

- Module 1 - Introduction to Jython
- Module 2 - Jython language and semantics
- Module 3 - Data types
- Module 4 - Regular expressions
- Module 5 - Functions, debugging, modules, and packages
- Module 6 - Objects, classes and exceptions
- Module 7 - Java integration
- Module 8 - Testing
- **Module 9 - System programming**
- Module 10 - Conclusion

Topics

- File handling
- Threading
- Queues
- Profiling
- Quiz
- Q & A

File handling

Common functions

open(fname, access_mode, buffering)

read(byte_cnt) - read the entire file

readline()

readlines() - read a line delimited by a newline

The line separator is defined in
the `os` module

write(data)

close()

- Module: `os`

os.rename()

os.remove()/os.unlink()

- Module : `shutil`

- high level file copy and delete operations

Rename

- Use the os module
 - *rename* renames the file

Delete

- Use the os module
 - *remove()* and *unlink()* are synonymous

More of os module

Overview

- Miscellaneous OS interfaces
 - Actually a package (os, and os.path)

Function	Description
environ, getenv(name, [, defval]), putenv(name, val)	1. environ is mapping to the environment hash 2. getenv() returns named env variable 3. putenv() creates an environment variable
chdir() getcwd()/curdir()	1. chdir() - change directory 2. getcwd()/curdir() - current working directory
system()	Execute system command
walk()	Walk directory tree (top or bottom)

os.path

- Useful pathname functions

Function	Description
<code>abspath()</code>	Normalized absolute path
<code>basename()</code>	Base name of a path (not the same as the UNIX <code>basename</code> program)
<code>dirname()</code>	Directory name of the path
<code>exists()</code>	Test if path exists
<code>join()</code>	Intelligent building of paths (uses <code>os.sep</code>)
<code>sep</code>	Platform specific path separator
<code>splitext()</code>	Split path into root and extension (leading <code>'.'</code> are ignored)

Archive files

Modules

- Three modules
 - gzip - interface to GNU zip and unzip utilities
 - Compression provided by *zlib*
 - zip - interface to create, read, write, append ZIP files
 - Does not support multi-disk ZIP files
 - tarfile - create a tape archive file
 - Multiple compression methods (depends on what is installed on your system)
- Also - shutil archive methods

Module: shutil

- High level file and file collections copy and delete operations
 - Very fast
- Directory and file operations
- Archiving operations

<https://docs.python.org/2/library/shutil.html>

Process creation

Module: subprocess

subprocess

- Create subprocesses, connect to their input, output, and error pipes (file descriptors), and obtain the return code
- The subprocess module is meant to replace
 - `os.system()`
 - `os.spawn*`
 - `os.popen*`
 - `popen2.*`
 - `commands.*`

Threading

Important

- There is a BIG difference between Python and Jython
 - CPython uses the *Global Interpreter Lock*
 - Only one thread can execute Python code
 - Jython uses Java threads

Threading

- Interface to manage concurrent threads
 - Builds on thread module
 - Low level primitives - do not use
- Allows programs to to run multiple operations within the same process space

How to do it

- Define function to perform the work
- Create a thread object
- Always call with keyword arguments

```
import threading
th = threading.Thread(target=worker)
threads.append(th)
th.start()
```
- *target* argument is the name of the worker function

Basics I

python file.py

statement₁

statement₂

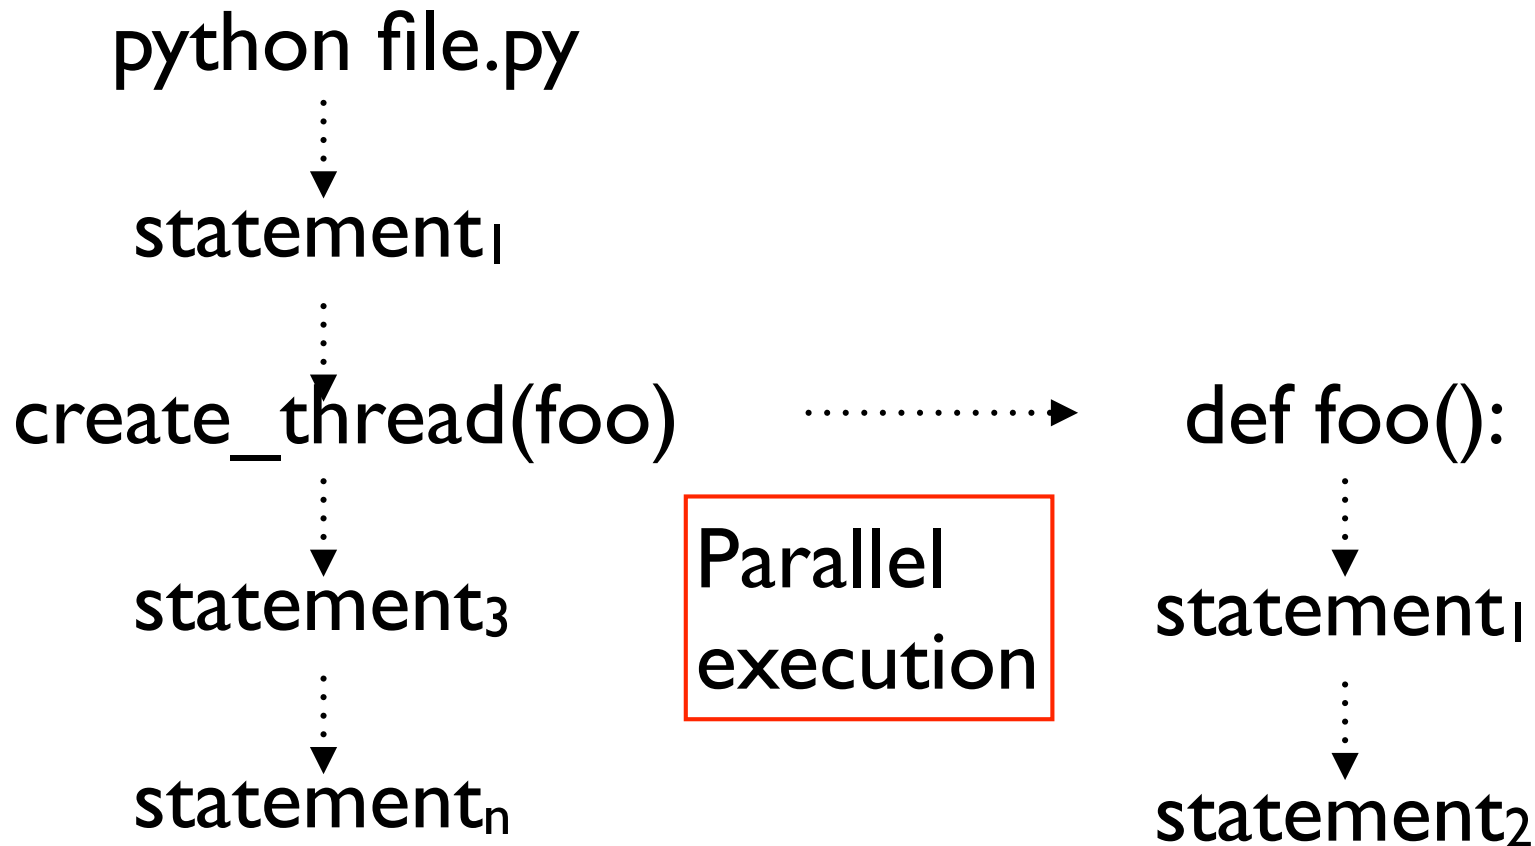

statement₃

At program launch, python
begins executing
statements.

Main thread

Basics₂

Thread objects

- Separate thread of control
- Once created, just be started by `start()`
- Other threads can *join()* a thread
- Threads have names (default is “Thread_1”)

Queues

- Best practice in Python to use queues
 - Safer programming
 - Resource access

```
cerro-colorado:jython2.5.3 rereidy$ python
Python 2.7.6 (default, Sep  9 2014, 15:04:36)
[GCC 4.2.1 Compatible Apple LLVM 6.0 (clang-600.0.39)] on darwin
Type "help", "copyright", "credits" or "license" for more information.
>>> import Queue
>>> dir(Queue)
['Empty', 'Full', 'LifoQueue', 'PriorityQueue', 'Queue', '__all__', '__builtins__', '__doc__', '__file__', '__name__', '__packag
e__', '_threading', '_time', 'deque', 'heapq']
>>>
```

```
cerro-colorado:jython2.5.3 rereidy$ java -jar jython.jar
Jython 2.5.3 (2.5:c56500f08d34+, Aug 13 2012, 14:48:36)
[Java HotSpot(TM) 64-Bit Server VM (Oracle Corporation)] on java1.8.0_45
Type "help", "copyright", "credits" or "license" for more information.
>>> import Queue
>>> dir(Queue)
['Empty', 'Full', 'Queue', '__all__', '__doc__', '__file__', '__name__', '_time', 'deque']
>>>
```

```
cerro-colorado:jython2.7.0 rereidy$ java -jar jython.jar
Jython 2.7.0 (default:9987c746f838, Apr 29 2015, 02:25:11)
[Java HotSpot(TM) 64-Bit Server VM (Oracle Corporation)] on java1.8.0_45
Type "help", "copyright", "credits" or "license" for more information.
>>> import Queue
>>> dir(Queue)
['Empty', 'Full', 'LifoQueue', 'PriorityQueue', 'Queue', '__all__', '__builtins__', '__doc__', '__file__', '__name__', '__packag
e__', '_threading', '_time', 'deque', 'heapq']
>>>
```

Queues

- FIFO -First in, first out
 - Queue data structure
 - Only Queue in Jython 2.5
- LIFO - Last in, first out
 - Stack data structure
- Priority queue - processing order based on characteristics of items

Profiling

Module: profile

- Collect and analyze statistics for resource consumption by Python programs

- Basic

run()

```
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181, 6765]
```

57314 function calls (24 primitive calls) in 1.081 seconds

Ordered by: standard name

ncalls	totttime	percall	cumtime	percall	filename:lineno(function)
1	0.001	0.001	0.252	0.252	<string>:0(<module>)
57291/21	0.247	0.000	0.247	0.012	prof1.py:47(fib)
21/1	0.004	0.000	0.251	0.251	prof1.py:55(fib_seq)
1	0.830	0.830	1.081	1.081	profile:0(print fib_seq(20); print)
0	0.000		0.000		profile:0(profiler)

Recursive
calls

Primitive
calls

MEMOIZED

```
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181, 6765]
```

103 function calls (45 primitive calls) in 0.013 seconds

Ordered by: standard name

ncalls	totttime	percall	cumtime	percall	filename:lineno(function)
1	0.000	0.000	0.006	0.006	<string>:0(<module>)
59/21	0.003	0.000	0.004	0.000	prof1.py:73(__call__)
21	0.001	0.000	0.001	0.000	prof1.py:80(bif)
21/1	0.001	0.000	0.005	0.005	prof1.py:90(bif_seq)
1	0.007	0.007	0.013	0.013	profile:0(print bif_seq(20); print)
0	0.000		0.000		profile:0(profiler)

calls

Primitive
calls

Quiz

1. What is the name of the attribute in the `os` module that defines the platform specific line separator?

A. `os.linesep`

2. What is the value on your computer?

A. Mac OS X: `'\n'`

3. Are the file contents affected when using `shutil.copymode()`?
- A. No - file contents, owner, and group and not affected.

4. What is the return value of the `system()` function?
 - A. The return value of the spawned (subprocess) command.

5. What does “shell=True” mean in the function calls in the subprocess module?
 - A. The command supplied will be executed through the shell.
6. What are the security implications of “shell=True”?
 - A. Unsanitized input from untrusted sources can lead to injection vulnerabilities,

Q & A

Exercises

- I. This will be a two part exercise:
 - a. Create a program using shutil to copy a file on your computer.

After you have copied the file, go out to the OS and make the file unwritable for your account.

- b. Create a 2nd program to copy the permission bits from the first file to the second file.

Discuss the outcome of number 2 in class.

2. Create a program which will recursively traverse directories and print a hierarchical file listing:

dirA

- - - - file1.ext

- - - - file2.ext

- - - - dirB

- - - - - file1.ext

- - - - - file2.ext

- - - - dirC

etc.

Use `os.walk()` to generate the file list (see
'`help(os.walk)`')

3. Create a program to print the file stats for a given file name:

- size
- creation time
- last access time
- last modified time

Use jython 2.7 and the `collections.namedtuple` type to store intermediate results.

Use `os.stat()` to get file stats.

4. Write a program to copy a directory to a temporary directory using `shutil`. Profile the code and discuss your results.
 - a. What at the top 4 recursive calls?
 - i) What is the total CPU time for these calls?
 - ii) What modules and methods are being called?
 - iii) Examine the module `Lib/shutil.py`, method `copytree()`. How does this method get its list of files to copy?
